Specs from the Michigan Department of Technology, Management and Budget (DTMB)

Face Shields:
1. Any new eye and face protective devices must comply with American National Standards Institute (ANSI) Z87.1-1989 and OSHA Personal Protective Equipment guidelines
   a. OSHA definition: Face shields are transparent sheets of plastic extending from the eyebrows to below the chin and across the entire width of the employee’s head. Some are polarized for glare protection. Face shields protect against nuisance dusts and potential splashes or sprays of hazardous liquids but will not provide adequate protection against impact hazards. Face shields used in combination with goggles or safety spectacles will provide additional protection against impact hazards.
2. An employer may choose to provide one pair of protective eyewear for each position rather than individual eyewear for each employee. If this is done, the employer must make sure that employees disinfect shared protective eyewear after each use.
3. Fog Test
